IN PARTICULAR, SUPER MICRO COMPUTER, INC. SHALL NOT HAVE LIABILITY FOR ANY HARDWARE, SOFTWARE, OR DATA STORED OR USED WITH THE PRODUCT, INCLUDING THE COSTS OF REPAIRING, REPLACING, INTEGRATING, INSTALLING OR RECOVERING SUCH HARDWARE, SOFTWARE, OR DATA.

Any disputes arising between manufacturer and customer shall be governed by the laws of Santa Clara County in the State of California, USA. The State of California. County of Santa Clara shall be the exclusive venue for the resolution of any such disputes. Supermicro's total liability for all claims will not exceed the price paid for the hardware product.

FCC Statement: This equipment has been tested and found to comply with the limits for a Class A digital device pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the manufacturer's instruction manual, may cause harmful interference with radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case you will be required to correct the interference at your own expense.

California Best Management Practices Regulations for Perchlorate Materials: This Perchlorate warning applies only to products containing CR (Manganese Dioxide) Lithium coin cells. "Perchlorate Material-special handling may apply. See www.dtsc.ca.gov/hazardouswaste/perchlorate".

WARNING: This product can expose you to chemicals including lead, known to the State of California to cause cancer and birth defects or other reproductive harm. For more information, go to www.P65Warnings.ca.gov.

The products sold by Supermicro are not intended for and will not be used in life support systems, medical equipment, nuclear facilities or systems, aircraft, aircraft devices, aircraft/emergency communication devices or other critical systems whose failure to perform be reasonably expected to result in significant injury or loss of life or catastrophic property damage. Accordingly, Supermicro disclaims any and all liability, and should buyer use or sell such products for use in such ultra-hazardous applications, it does so entirely at its own risk. Furthermore, buyer agrees to fully indemnify, defend and hold Supermicro harmless for and against any and all claims, demands, actions, litigation, and proceedings of any kind arising out of or related to such ultra-hazardous use or sale.

Preface

About This Manual

This manual is written for system integrators, IT technicians and knowledgeable end users. It provides information for the installation and use of the motherboard.

About This Motherboard

The Supermicro X12STH-F/LN4F motherboard supports the Intel® Xeon E-2300 and 10th Generation Pentium processor in an H5 LGA1200 socket. Built with the Intel PCH C256 chipset, the X12STH-F/LN4F motherboard supports 128GB DDR4 ECC UDIMM memory with speeds of up to 3200 MHz, SATA 3.0 ports, M.2, 1G Base-T ports, and a Trusted Platform Module (TPM) header. Please note that this motherboard is intended to be installed and serviced by professional technicians only. For processor/memory updates, please refer to our website at http://www.supermicro.com/products/.

Conventions Used in the Manual

Special attention should be given to the following symbols for proper installation and to prevent damage done to the components or injury to yourself:

- **Warning!** Indicates important information given to prevent equipment/property damage or personal injury.

- **Warning!** Indicates high voltage may be encountered while performing a procedure.

- **Important:** Important information given to ensure proper system installation or to relay safety precautions.

- **Note:** Additional Information given to differentiate various models or to provide information for proper system setup.

Introduction

Congratulations on purchasing your computer motherboard from an industry leader. Supermicro motherboards are designed to provide you with the highest standards in quality and performance.

In addition to the motherboard, several important parts that are included in the retail box are listed below. If anything listed is damaged or missing, please contact your retailer.

### Motherboard Features

#### Peripheral Devices

- Two USB 2.0 ports on the rear I/O panel (USB0/1)
- Two front accessible USB 2.0 headers with two USB connections (USB2/3, USB4/5)
- Two USB 3.2 Gen 1x1 ports on the rear I/O panel (USB6/7)
- One USB 3.2 Gen 1x1 Type-A header (USB8)
- One front Accessible USB 3.2 Gen 1x1 Header (USB9/10)

#### BIOS

- 256 Mb AMI BIOS® SPI Flash BIOS
- ACPI 6.0, Plug and Play (PnP), BIOS rescue hot-key, and SMBIOS 3.0 or later

#### Power Management

- ACPI power management
- Power button override mechanism
- Power-on mode for AC power recovery
- Wake-on-LAN

#### System Health Monitoring

- Onboard voltage monitoring for 12 V, 5 V, 3.3 V, VBAT, 5 VSB, 3.3 VSB, 1.8_PCH, VCCIN_AUX_PCH, 1.05 V_PCH, 2.5 V_BMC, 1.8 V_BMC, Memory, CPU, 3.3V_RGM_BMC, VCCSA, VCCIO, CPU temperature, PCH temperature, System temperature, and DIMM temperature
- CPU switch phase voltage regulator
- CPU thermal trip support
- Platform Environment Control Interface (PECI)/TSI

#### Fan Control

- Fan status monitoring via IPMI connections
- Dual cooling zones
- Six 4-pin fan headers

#### System Management

- Trusted Platform Module (TPM) support
- SuperDoctor® 5
- Chassis intrusion header and detection

#### LED Indicators

- Power indicator LED
- LAN activity LED

#### Dimensions

- 9.6” (W) x 9.6” (L) Micro ATX (243.84 mm x 243.84 mm)

**Note:** The CPU maximum thermal design power (TDP) is subject to chassis and heatsink cooling restrictions. For proper thermal management, please check the chassis and heatsink specifications for proper CPU TDP sizing.
Note: This is a general block diagram and may not exactly represent the features on your motherboard. See the previous pages for the actual specifications of your motherboard.
1.2 Processor and Chipset Overview

Built upon the functionality and capability of the Intel Xeon E-2300 and 10th Generation Pentium (Socket H5 - LGA 1200) series processor and the Intel C256 chipset, the X12STH-F/LN4F motherboard provides system performance, power efficiency, and feature sets to address the needs of next-generation computer users.

The X12STH-F/LN4F motherboard dramatically increases system performance for a multitude of server applications.

The Intel Xeon E-2300, 10th Generation Pentium processor and the C256 chipset support the following features:

- USB 3.2 Gen 1x1 (one Type-A, two via header) and SATA 3.0
- Intel Hyper-Threading, Intel VT-D, VT-x
- Intel SGX
- Intel Turbo Boost Technology
- Intel VROC
- Maximum of 128 GB DDR4 ECC UDIMM memory support with speeds of up to 3200 MHz

**Note**: Intel TXT is only supported in the UEFI boot mode. Please install the UEFI OS and then enable the Intel TXT feature.

1.3 Special Features

**Recovery from AC Power Loss**

The Basic I/O System (BIOS) provides a setting that determines how the system will respond when AC power is lost and then restored to the system. You can choose for the system to remain powered off (in which case you must press the power switch to turn it back on), or for it to automatically return to the power-on state. See the Advanced BIOS Setup section for this setting. The default setting is **Last State**.
1.4 System Health Monitoring

**Onboard Voltage Monitors**

The onboard voltage monitor will continuously scan crucial voltage levels. Once a voltage becomes unstable, a warning is given, or an error message is sent to the screen.

**Environmental Temperature Control**

The CPU fan is always on, not dependent on any user-defined threshold. The CPU fan speed is adjusted automatically according to the CPU temperature to prevent overheating.

*Note:* To avoid possible system overheating, please provide adequate airflow to your system.

**System Resource Alert**

This feature is available when used with SuperDoctor 5® in the Windows OS or in the Linux environment. SuperDoctor is used to notify the user of certain system events. For example, you can configure SuperDoctor to provide you with warnings when the system temperature, CPU temperatures, voltages and fan speeds go beyond a predefined range.

1.5 ACPI Features

The Advanced Configuration and Power Interface (ACPI) specification defines a flexible and abstract hardware interface that provides a standard way to integrate power management features throughout a computer system, including its hardware, operating system and application software. This enables the system to automatically turn on and off peripherals such as CD-ROMs, network cards, hard disk drives and printers.

In addition to enabling operating system-directed power management, ACPI also provides a generic system event mechanism for Plug and Play, and an operating system-independent interface for configuration control. ACPI leverages the Plug and Play BIOS data structures, while providing a processor architecture-independent implementation that is compatible with appropriate Windows operating systems. For detailed information regarding OS support, please refer to the Supermicro website.
1.6 Power Supply

As with all computer products, a stable power source is necessary for proper and reliable operation. It is even more important for processors that have high CPU clock rates. In areas where noisy power transmission is present, you may choose to install a line filter to shield the computer from noise. It is recommended that you also install a power surge protector to help avoid problems caused by power surges.

1.7 Serial Port

The X12STH-F/LN4F motherboard has one serial port port on the I/O back panel and one header.
Chapter 2

Installation

2.1 Static-Sensitive Devices

Electrostatic Discharge (ESD) can damage electronic components. To avoid damaging your system board, it is important to handle it very carefully. The following measures are generally sufficient to protect your equipment from ESD.

Precautions

• Use a grounded wrist strap designed to prevent static discharge.

• Touch a grounded metal object before removing the board from the antistatic bag.

• Handle the motherboard by its edges only; do not touch its components, peripheral chips, memory modules or gold contacts.

• When handling chips or modules, avoid touching their pins.

• Put the motherboard and peripherals back into their antistatic bags when not in use.

• For grounding purposes, make sure that your computer chassis provides excellent conductivity between the power supply, the case, the mounting fasteners and the motherboard.

• Use only the correct type of onboard CMOS battery. Do not install the onboard battery upside down to avoid possible explosion.

Unpacking

The motherboard is shipped in antistatic packaging to avoid static damage. When unpacking the motherboard, make sure you are static protected.
2.2 Processor and Heatsink Installation

**Warning:** When handling the processor package, avoid placing direct pressure on the label area of the fan.

**Important:**

- Use ESD protection.
- Unplug the AC power cord from all power supplies after shutting down the system.
- Check that the plastic protective cover is on the CPU socket and none of the socket pins are bent. If they are, contact your retailer.
- When handling the processor, avoid touching or placing direct pressure on the LGA lands (gold contacts). Improper installation or socket misalignment can cause serious damage to the processor or CPU socket, which may require manufacturer repairs.
- Thermal grease is pre-applied on a new heatsink. No additional thermal grease is needed.
- Refer to the Supermicro website for updates on processor support.
- All graphics in this manual are for illustrations only. Your components may look different.

**Installing the LGA1200 Processor**

1. Press the load lever down to release the load plate from its locking position.
2. Gently lift the load lever to open the load plate. Remove the plastic protective cover. Do not touch the CPU socket contacts.

3. Locate the triangle on the CPU and CPU socket, which indicates the location of Pin 1. Holding the CPU by the edges with your thumb and index finger, align the triangle on the CPU with the triangle on the socket. The CPU keys (the semi-circle cutouts) may also be aligned against the socket keys as a guide.

4. Carefully lower the CPU straight down into the socket. Do not drop the CPU on the socket, or move it horizontally or vertically to avoid damaging the CPU or socket. Inspect the four corners of the CPU to make sure that the CPU is properly installed.
5. Close the load plate, then gently push down the load lever into its locking position.

**Note:** You can only install the CPU in one direction. Make sure it is properly inserted into the socket before closing the load plate. If it doesn't close properly, do not force it as it may damage your CPU. Instead, open the load plate again and double-check that the CPU is properly aligned.

**Installing an Active CPU Heatsink with Fan**

1. Locate the CPU fan header on the motherboard (FAN1: CPU FAN).

2. Position the heatsink so that the heatsink fan wires are closest to the CPU fan header and are not interfering with other components.

3. Inspect the CPU fan wires to make sure they are routed through the bottom of the heatsink.

4. Remove the thin layer of protective film from the heatsink. CPU overheating may occur if the protective film is not removed from the heatsink.

5. Apply the proper amount of thermal grease on the CPU. If your heatsink came with a thermal pad, please ignore this step.
6. Align the four heatsink fasteners with the mounting holes on the motherboard. Gently push down the fasteners in a diagonal order (Example: #1 and #2, then #3 and #4) into the mounting holes until you hear a click, then lock the fasteners by turning each one 90° clockwise.

7. Once all four fasteners are secured, connect the heatsink fan wire connector to the CPU fan header.
Removing the Heatsink

Note: We do not recommend that the CPU or heatsink be removed. However, if you do need to remove the heatsink, please follow the instructions below to remove the heatsink and prevent damage done to the CPU or other components.

1. Unplug the power connector from the power supply.
2. Disconnect the heatsink fan connector from the CPU fan header.
3. Gently press down each fastener cap and turn them 90° counter clockwise, then pull the fasteners upwards to loosen them.
4. Remove the heatsink from the CPU.
2.3 Motherboard Installation

All motherboards have standard mounting holes to fit different types of chassis. Make sure that the locations of all the mounting holes for both the motherboard and the chassis match. Although a chassis may have both plastic and metal mounting fasteners, metal ones are highly recommended because they ground the motherboard to the chassis. Make sure that the metal standoffs click in or are screwed in tightly.

**Tools Needed**

- Phillips Screwdriver (1)
- Phillips Screws (8)
- Standoffs (8) Only if Needed

**Location of Mounting Holes**

- **Note 1:** To avoid damaging the motherboard and its components, please do not use a force greater than 8 lbf-in on each mounting screw during motherboard installation.

- **Note 2:** Some components are very close to the mounting holes. Please take precautionary measures to avoid damaging these components when installing the motherboard to the chassis.
Installing the Motherboard

1. Install the I/O shield into the back of the chassis, if applicable.

2. Locate the mounting holes on the motherboard. See the previous page for the location.

3. Locate the matching mounting holes on the chassis. Align the mounting holes on the motherboard against the mounting holes on the chassis.

4. Install standoffs in the chassis as needed.

5. Install the motherboard into the chassis carefully to avoid damaging other motherboard components.

6. Using the Phillips screwdriver, insert a pan head #6 screw into a mounting hole on the motherboard and its matching mounting hole on the chassis.

7. Repeat Step 6 to insert #6 screws into all mounting holes.

8. Make sure that the motherboard is securely placed in the chassis.

   **Note 1:** Images displayed are for illustration only. Your chassis or components might look different from those shown in this manual.

   **Note 2:** The X12STH-F/LN4F motherboard mounting holes may not be compatible with all chassis. It is recommended to use validated Supermicro chassis.
2.4 Memory Support and Installation

**Note:** Check the Supermicro website for recommended memory modules.

**Important:** Exercise extreme care when installing or removing DIMM modules to prevent any possible damage.

**Memory Support**

The X12STH-F/LN4F motherboard supports up to 128 GB of DDR4 ECC UDIMM memory with speeds of up to 3200 MHz in four memory slots. Speed support is up to 2666 MHz when a Pentium processor is installed. Speed support is up to 2933 MHz for 2R2R configurations. Refer to the table below for the recommended DIMM population order.

General Guidelines for Optimizing Memory Performance

- The blue slots must be populated first.
- It's recommended to use DDR4 memory of the same type, size, and speed.
- Mixed DIMM speeds can be installed. However, all DIMMs will run at the speed of the slowest DIMM.
- The motherboard will support odd-numbered modules (one or three modules installed). However, to achieve the best memory performance, a balanced memory population is recommended.
**DIMM Installation**

1. Insert DIMM modules in the following order: DIMMB2, DIMMA2, then DIMMB1, DIMMA1. For the system to work properly, use memory modules of the same type and speed.

2. Align the DIMM module key with the receptive point on the single-latch DIMM slot.

3. Push the release tab outwards to unlock the slot.

4. Align the notch on the end of the module against the receptive point on the end of the slot.

5. Press both ends of the module straight down into the slot until the module snaps into place.

6. Push the release tab to the lock position to secure the module into the slot.

**DIMM Removal**

Press the release tab on one end of the DIMM module to unlock it. Once the DIMM module is loosened, remove it from the memory slot.
2.5 Rear I/O Ports

See Figure 2-1 below for the locations and descriptions of the various I/O ports on the rear of the motherboard.

LAN Ports

The X12STH-F motherboard has two gigabit Ethernet ports (LAN1, LAN2) on the back I/O panel, while the X12STH-LN4F motherboard has four (LAN1–LAN4). In addition to the LAN ports, a dedicated BMC LAN port is located above USB0/1. Please refer to the LED Indicator section for LAN LED information.

Universal Serial Bus (USB) Ports

There are two USB 2.0 ports (USB0/1) on the I/O back panel and two USB 2.0 headers (USB2/3 and USB4/5) on the motherboard. The motherboard also has two USB 3.2 Gen 1 ports (USB6/7) on the I/O back panel and one front access USB 3.2 Gen 1 header (USB9/10). The USB8 header is USB 3.2 Type-A. The onboard headers can be used to provide front side USB access with a cable (not included).

Unit Identifier Switch (UID-SW): One button with two functions

A Unit Identifier (UID) switch and two LED Indicators are located on the motherboard. The UID switch is located JUIDB1. The UID LED (LED1) is located next to the UID switch. When you press the switch, the LED will be turned on, which provides easy identification of a system unit that may be in need of service. Press the switch again to turn off the LED indicator. UID can also be triggered via IPMI on the motherboard. For more information on IPMI, please refer to the IPMI User's Guide posted on our website: https://www.supermicro.com/support/manuals/

2.6 Front Control Panel

JF1 contains header pins for various buttons and indicators that are normally located on a control panel at the front of the chassis. These connectors are designed specifically for use with Supermicro chassis. See the figure below for the descriptions of the front control panel buttons and LED indicators.

Figure 2-2. JF1 Header Pins
Power Button

The Power Button connection is located on pins 1 and 2 of JF1. Momentarily contacting both pins will power on/off the system. This button can also be configured to function as a suspend button (with a setting in the BIOS - see Chapter 4). To turn off the power when the system is in suspend mode, press the button for 4 seconds or longer. Refer to the table below for pin definitions.

Headers

Fan Headers

There are six 4-pin fan headers (FAN1–FAN4, FANA, FANB) on the motherboard. All these 4-pin fan headers are backwards compatible with the traditional 3-pin fans. However, fan speed control is available for 4-pin fans only by Thermal Management via the Hardware Monitoring through BMC. Refer to the table below for pin definitions.

TPM/Port 80 Header

A Trusted Platform Module (TPM)/Port 80 header is located at JTPM1 to provide TPM support and Port 80 connection. Use this header to enhance system performance and data security. Refer to the table below for pin definitions. Please go to the following link for more information on the TPM: http://www.supermicro.com/manuals/other/TPM.pdf.

SATA 3.0 Ports/Mini-SAS

The X12STH-F/LN4F supports eight SATA 3.0 ports via mini-SAS HD (JSATA: I-SATA0–3) and standard SATA (I-SATA4–7) connectors. These Intel PCH SATA 3.0 ports supports RAID 0, 1, 5, and 10.

JSATA is the Mini-SAS HD connector. JSATA to four SATA with sideband connections for storage.

M.2 Slot
This motherboard has one M.2 slot. M.2 was formerly known as Next Generation Form Factor (NGFF) and serves to replace mini PCIe. M.2 allows for a variety of card sizes, increased functionality, and spatial efficiency. The M.2 slot on the motherboard supports PCIe 3.0 x4 SSD cards in the 2280 and 22110 form factors.

Link Activity LED Headers
There are two LAN Activity LED headers on the X12STH-LN4F motherboard. JLD1 enables the LED for LAN3 and JLD2 enables LAN4. Attach the Network Interface Controller (NIC) cables here to display network activity.

2.8 Jumper Settings

How Jumpers Work
To modify the operation of the motherboard, jumpers can be used to choose between optional settings. Jumpers create shorts between two pins to change the function of the connector. Pin 1 is identified with a square solder pad on the printed circuit board. See the diagram below for an example of jumping pins 1 and 2. Refer to the motherboard layout page for jumper locations.

Note: On two-pin jumpers, "Closed" means the jumper is on and "Open" means the jumper is off the pins.

CMOS Clear
JBT1 is used to clear CMOS, which will also clear any passwords. Instead of pins, this jumper consists of contact pads to prevent accidentally clearing the contents of CMOS.

To Clear CMOS
1. First power down the system and unplug the power cord(s).
2. Remove the cover of the chassis to access the motherboard.
3. Remove the onboard battery from the motherboard.
4. Short the CMOS pads with a metal object such as a small screwdriver for at least four seconds.
5. Remove the screwdriver (or shorting device).
6. Replace the cover, reconnect the power cord(s), and power on the system.

Note: Clearing CMOS will also clear all passwords.
Watchdog Timer

Watchdog (JWD1) is a system monitor that can reboot the system when a software application hangs. Close pins 1-2 to reset the system if an application hangs. Close pins 2-3 to generate a non-maskable interrupt (NMI) signal for the application that hangs. Refer to the table below for jumper settings. The Watchdog must also be enabled in the BIOS.

Chapter 3

Troubleshooting

3.1 Troubleshooting Procedures

Use the following procedures to troubleshoot your system. If you have followed all of the procedures below and still need assistance, refer to the ‘Technical Support Procedures’ and/or ‘Returning Merchandise for Service’ section(s) in this chapter. Always disconnect the AC power cord before adding, changing or installing any non hot-swap hardware components.

Before Power On

1. Inspect the motherboard visually to make sure there is no physical damage such as bent pins in CPU socket or DIMM slots.

2. Disconnect all components not required to verify the motherboard’s power is on.

3. Make sure the CPU, memory, and heatsink are properly installed.

4. Verify the power supply and front panel header connections to motherboard.

No Power

1. Make sure that there are no short circuits between the motherboard and the chassis.

2. Make sure that the ATX power connectors are properly connected.

3. Check that the 115 V/230 V switch, if available, on the power supply is properly set.

4. Turn the power switch on and off to test the system, if applicable.

5. Verify the onboard Power LED is on and if there is any activity with the fans and BMC heartbeat LED3.
**No Video**

1. If the power is on, but you have no video, remove all add-on cards and cables.

2. Use the speaker to determine if any beep codes are present. Refer to Appendix A for details on beep codes.

3. Remove all memory modules and turn on the system (if the alarm is on, check the specs of memory modules, reset the memory or try a different one).

4. Verify JPG1 is on pins 1-2 to enable video.

5. Verify the monitor is on.

**System Boot Failure**

If the system does not display Power-On-Self-Test (POST) or does not respond after the power is turned on, check the following:

1. Check for any error beep from the motherboard speaker.
   - If there is no error beep, try to turn on the system without DIMM modules installed. If there is still no error beep, replace the motherboard.
   - If there are error beeps, clear the CMOS settings by unplugging the power cord and contacting both pads on the CMOS clear jumper (JBT1). Refer to Section 2-8 in Chapter 2.

2. Remove all components from the motherboard, especially the DIMM modules. Make sure that system power is on and that memory error beeps are activated.

3. Turn on the system with only one DIMM module installed. If the system boots, check for bad DIMM modules or slots by following the Memory Errors Troubleshooting procedure in this chapter.

**Memory Errors**

When a no-memory beep code is issued by the system, check the following:

1. Make sure that the memory modules are compatible with the system and are properly installed. See Chapter 2 for installation instructions. (For memory compatibility, refer to the "Tested Memory List" link on the motherboard's product page to see a list of supported memory.)

2. Check if different speeds of DIMMs have been installed. It is strongly recommended that you use the same RAM type and speed for all DIMMs in the system.
3. Make sure that you are using the correct type of ECC DDR4 modules recommended by the manufacturer.

4. Check for bad DIMM modules or slots by swapping a single module among all memory slots and check the results.

**Losing the System's Setup Configuration**

1. Make sure that you are using a high-quality power supply. A poor-quality power supply may cause the system to lose the CMOS setup information. Refer to Chapter 2 for details on recommended power supplies.

2. The battery on your motherboard may be old. Check to verify that it still supplies approximately 3 VDC. If it does not, replace it with a new one.

3. If the above steps do not fix the setup configuration problem, contact your vendor for repairs.

**When the System Becomes Unstable**

_A. If the system becomes unstable during or after OS installation, check the following:_

1. CPU/BIOS support: Make sure that your CPU is supported and that you have the latest BIOS installed in your system.

2. Memory support: Make sure that the memory modules are supported by testing the modules using memtest86 or a similar utility.

   **Note:** Click on the "Tested Memory List" link on the motherboard's product page to see a list of supported memory.

3. HDD support: Make sure that all hard disk drives (HDDs) work properly. Replace the bad HDDs with good ones.

4. Check the hardware monitoring settings on the BMC webpage or with BMC tools to make sure that the CPU and system temperatures are within the normal range.

5. Adequate power supply: Make sure that the power supply provides adequate power to the system. Make sure that all power connectors are connected. Please refer to our website for more information on the minimum power requirements.

6. Proper software support: Make sure that the correct drivers are used.
B. If the system becomes unstable before or during OS installation, check the following:

1. Source of installation: Make sure that the devices used for installation are working properly, including boot devices such as CD/DVD.

2. Cable connection: Check to make sure that all cables are connected and working properly.

3. Use the minimum configuration for troubleshooting: Remove all unnecessary components (starting with add-on cards first), and use the minimum configuration (but with the CPU and a memory module installed) to identify the trouble areas. Refer to the steps listed in Section A above for proper troubleshooting procedures.

4. Identify bad components by isolating them: If necessary, remove a component in question from the chassis, and test it in isolation to make sure that it works properly. Replace a bad component with a good one.

5. Check and change one component at a time instead of changing several items at the same time. This will help isolate and identify the problem.

6. To find out if a component is good, swap this component with a new one to see if the system will work properly. If so, then the old component is bad. You can also install the component in question in another system. If the new system works, the component is good and the old system has problems.
3.2 Technical Support Procedures

Before contacting Technical Support, please take the following steps. Also, please note that as a motherboard manufacturer, Supermicro also sells motherboards through its channels, so it is best to first check with your distributor or reseller for troubleshooting services. They should know of any possible problems with the specific system configuration that was sold to you.

1. Please go through the Troubleshooting Procedures and Frequently Asked Questions (FAQ) sections in this chapter or see the FAQs on our website (http://www.supermicro.com/FAQ/index.php) before contacting Technical Support.

2. BIOS upgrades can be downloaded from our website (http://www.supermicro.com/ResourceApps/BIOS_IPMI:Intel.html).

3. If you still cannot resolve the problem, include the following information when contacting Supermicro for technical support:

   • Motherboard model and PCB revision number

   • BIOS release date/version (This can be seen on the initial display when your system first boots up.)

   • System configuration

5. Distributors: For immediate assistance, please have your account number ready when placing a call to our Technical Support department. We can be reached by email at support@supermicro.com.
3.3 Frequently Asked Questions

Question: What type of memory does my motherboard support?

Answer: The motherboard supports up to 128 GB of DDR4 ECC UDIMM memory with speeds of up to 3200 MHz in four memory slots. To enhance memory performance, do not mix memory modules of different speeds and sizes. Please follow all memory installation instructions given on Section 2-4 in Chapter 2.

Question: How do I update my BIOS?

Answer: It is recommended that you do not upgrade your BIOS if you are not experiencing any problems with your system. Updated BIOS files are located on our website at http://www.supermicro.com/ResourceApps/BIOS_IPMI_Intel.html. Please check our BIOS warning message and the information on how to update your BIOS on our website. Select your motherboard model and download the BIOS file to your computer. Also, check the current BIOS revision to make sure that it is newer than your BIOS before downloading. Please unzip the BIOS file onto a bootable USB device. Run the batch file using the format FLASH.BAT filename.rom from your bootable USB device to flash the BIOS. Then, your system will automatically reboot.

Warning: Do not shut down or reset the system while updating the BIOS to prevent possible system boot failure!

Note: The SPI BIOS chip used on this motherboard cannot be removed. Send your motherboard back to our RMA Department at Supermicro for repair. For BIOS Recovery instructions, please refer to the AMI BIOS Recovery Instructions posted at http://www.supermicro.com/support/manuals/.
3.4 Battery Removal and Installation

**Battery Removal**

To remove the onboard battery, follow the steps below:

1. Power off your system and unplug your power cable.

2. Locate the onboard battery as shown below.

3. Using a tool such as a pen or a small screwdriver, push the battery lock outwards to unlock it. Once unlocked, the battery will pop out from the holder.

4. Remove the battery.

**Proper Battery Disposal**

**Warning:** Please handle used batteries carefully. Do not damage the battery in any way; a damaged battery may release hazardous materials into the environment. Do not discard a used battery in the garbage or a public landfill. Please comply with the regulations set up by your local hazardous waste management agency to dispose of your used battery properly.

**Battery Installation**

1. To install an onboard battery, follow steps 1 and 2 above and continue below:

2. Identify the battery's polarity. The positive (+) side should be facing up.

3. Insert the battery into the battery holder and push it down until you hear a click to ensure that the battery is securely locked.

**Warning:** When replacing a battery, be sure to only replace it with the same type.
3.5 Returning Merchandise for Service

A receipt or copy of your invoice marked with the date of purchase is required before any warranty service will be rendered. You can obtain service by calling your vendor for a Returned Merchandise Authorization (RMA) number. When returning the motherboard to the manufacturer, the RMA number should be prominently displayed on the outside of the shipping carton, and the shipping package is mailed prepaid or hand-carried. Shipping and handling charges will be applied for all orders that must be mailed when service is complete. For faster service, you can also request a RMA authorization online (http://www.supermicro.com/RmaForm/).

This warranty only covers normal consumer use and does not cover damages incurred in shipping or from failure due to the alternation, misuse, abuse or improper maintenance of products.

During the warranty period, contact your distributor first for any product problems.
Chapter 4

UEFI BIOS

4.1 Introduction

This chapter describes the AMIBIOS™ Setup utility for the motherboard. The BIOS is stored on a chip and can be easily upgraded using a flash program.

**Note:** Due to periodic changes to the BIOS, some settings may have been added or deleted and might not yet be recorded in this manual. Please refer to the Manual Download area of our website for any changes to the BIOS that may not be reflected in this manual.

**Starting the Setup Utility**

To enter the BIOS Setup Utility, hit the <Delete> key while the system is booting up. (In most cases, the <Delete> key is used to invoke the BIOS setup screen. There are a few cases when other keys are used, such as <F1>, <F2>, etc.) Each main BIOS menu option is described in this manual.

The Main BIOS screen has two main frames. The left frame displays all the options that can be configured. “Grayed-out” options cannot be configured. The right frame displays the key legend. Above the key legend is an area reserved for a text message. When an option is selected in the left frame, it is highlighted in white. Often a text message will accompany it. (Note that the BIOS has default text messages built in. We retain the option to include, omit, or change any of these text messages.) Settings printed in **Bold** are the default values.

A "►" indicates a submenu. Highlighting such an item and pressing the <Enter> key will open the list of settings within that submenu.

The BIOS setup utility uses a key-based navigation system called hot keys. Most of these hot keys (<F1>, <F2>, <F3>, <F4>, <Enter>, <ESC>, <Arrow> keys, etc.) can be used at any time during the setup navigation process.
4.2 Main Setup

When you first enter the AMI BIOS setup utility, you will enter the Main setup screen. You can always return to the Main setup screen by selecting the Main tab on the top of the screen. The Main BIOS setup screen is shown below and the following items will be displayed:

![AMI BIOS Setup Utility](image)

**System Date/System Time**

Use this option to change the system date and time. Highlight *System Date* or *System Time* using the arrow keys. Enter new values using the keyboard. Press the <Tab> key or the arrow keys to move between fields. The date must be entered in MM/DD/YYYY format. The time is entered in HH:MM:SS format.

*Note:* The time is in the 24-hour format. For example, 5:30 P.M. appears as 17:30:00. The date's default value is the BIOS build date after RTC reset.

**Supermicro X12STH-LN4F**

**BIOS Version**

This feature displays the version of the BIOS ROM used in the system.

**Build Date**

This feature displays the date when the version of the BIOS ROM used in the system was built.
Memory Information

Total Memory

This feature displays the total size of memory available in the system.
4.3 Advanced

Use this menu to configure the Advanced settings.

**Warning**: Take caution when changing the Advanced settings. An incorrect value, a very high DRAM frequency, or an incorrect DRAM timing setting may make the system unstable. When this occurs, revert to default manufacturer settings.

**Boot Feature**

**Quiet Boot**

Use this feature to select the screen display between the POST messages and the OEM logo upon bootup. Select Disabled to display the POST messages. Select Enabled to display the OEM logo instead of the normal POST messages. The options are Disabled and **Enabled**.

**Option ROM Messages**

Use this feature to set the display mode for the Option ROM. Select Keep Current to display the current AddOn ROM setting. Select Force BIOS to use the Option ROM display set by the system BIOS. The options are **Force BIOS** and Keep Current.
**Bootup NumLock State**
Use this feature to set the Power-on state for the <Numlock> key. The options are **On** and **Off**.

**Wait For "F1" If Error**
Use this feature to force the system to wait until the "F1" key is pressed if an error occurs. The options are **Disabled** and **Enabled**.

**INT19 Trap Response**
Interrupt 19 is the software interrupt that handles the boot disk function. When this feature is set to Immediate, the ROM BIOS of the host adapters will "capture" Interrupt 19 at bootup immediately and allow the drives that are attached to these host adapters to function as bootable disks. If this feature is set to Postponed, the ROM BIOS of the host adapters will not capture Interrupt 19 immediately and allow the drives attached to these adapters to function as bootable devices at bootup. The options are **Immediate** and **Postponed**.

**Re-try Boot**
If this feature is enabled, the BIOS will automatically reboot the system from a specified boot device after its initial boot failure. The options are **Disabled**, Legacy Boot, and EFI Boot.

**Power Configuration**

**Watch Dog Function**
If enabled, the Watch Dog Timer will allow the system to reset or generate NMI based on jumper settings when it is expired for more than five minutes. The options are **Disabled** and **Enabled**.

**Restore on AC Power Loss**
Use this feature to set the power state after a power outage. Select **Stay Off** for the system power to remain off after a power loss. Select **Power On** for the system power to be turned on after a power loss. Select **Last State** to allow the system to resume its last power state before a power loss. The options are **Stay Off**, **Power On**, and **Last State**.

**Power Button Function**
This feature controls how the system shuts down when the power button is pressed. Select **4 Seconds Override** to power off the system after pressing and holding the power button for four seconds or longer. Select **Instant Off** to instantly power off the system as soon as you press the power button. The options are **Instant Off** and **4 Seconds Override**.
CPU Configuration

The following CPU information will display:
- CPU Signature
- Microcode Patch
- CPU Speed
- L1 Data Cache
- L1 Instruction Cache
- L2 Cache
- L3 Cache
- VMX
- SMX/TXT

CPU Flex Ratio Override
Use this feature to enable or disable CPU Flex Ratio Programming. The options are Disabled and Enabled.

If the feature above is set to Enabled, the next feature is available for configuration:

CPU Core Flex Ratio
Use this feature to set the non-turbo mode processor core ratio multiplier. Enter a value. The default is 31.

Hardware Prefetcher
If this feature is set to Enabled, the hardware prefetcher prefetches streams of data and instructions from the main memory to the L2 cache to improve CPU performance. The options are Disabled and Enabled.

Adjacent Cache Line Prefetch
The CPU prefetches the cache line for 64 bytes if this feature is set to Disabled. The CPU prefetches both cache lines for 128 bytes as comprised if this feature is set to Enable. The options are Disabled and Enabled.

Intel (VMX) Virtualization Technology
Use this feature to enable the Vanderpool Technology. This technology allows the system to run several operating systems simultaneously. The options are Disabled and Enabled.
PECI
Use this feature to enable or disable Platform Environment Control Interface (PECI). The options are Disabled and Enabled.

AVX
Use this feature to enable or disable AVX 2/3 instructions. This application is for Big Core only. The options are Enabled and Disabled.

AVX3
Use this feature to enable or disable AVX 3 instructions. This application is for Big Core only. The options are Enabled and Disabled.

Active Processor Cores
Use this feature to select the number of cores to enable for each processor. The options are All, 1, 2, and 3.

BIST
Use this feature to enable or disable the built-in self test during boot up. The options are Disabled and Enabled.

AP threads Idle Manner
Use this feature to select the AP threads Idle manner. The options are HALT Loop, MWAIT Loop, and RUN Loop.

AES
Use this feature to enable or disable Advanced Encryption Standard. The options are Disabled and Enabled.

Machine Check
Use this feature to enable or disable Machine Check. The options are Disabled and Enabled.

Monitor MWait
Select Enabled to enable the Monitor/Mwait instructions. The Monitor instructions monitors a region of memory for writes, and MWait instructions instruct the CPU to stop until the monitored region begins to write. The options are Disabled and Enabled.

Power & Performance

Boot Performance Mode
This feature allows you to select the performance state that the BIOS will set before the operating system handoff. The options are Power Saving, Max Non-Turbo Performance, and Turbo Performance.
Intel® SpeedStep™
Intel SpeedStep Technology allows the system to automatically adjust processor voltage and core frequency to reduce power consumption and heat dissipation. The options are Disabled and Enabled.

Race to Halt (RTH)
Use this feature to enable Race to Halt, which dynamically increases CPU frequency in order to enter the package C-State faster. This will reduce overall power consumption. The options are Disabled and Enabled.

Intel® Speed Shift Technology
Use this feature to enable or disable Intel Speed Shift Technology support. When this feature is enabled, the Collaborative Processor Performance Control (CPPC) version 2 interface will be available to control CPU P-States. The options are Disabled, Native Mode, and Out of Band Mode.

Per Core P State OS control mode
Use this feature to enable Per Core P State OS control mode. The options are Disabled and Enabled.

HwP Autonomous Per Core P State
Use this feature to enable Per Core for P State. The options are Disabled and Enabled.

HwP Autonomous EPP Grouping
Use this feature to enable EPP grouping. The options are Disabled and Enabled.

Turbo Mode
Select Enable for processor cores to run faster than the frequency specified by the manufacturer. The options are Disabled and Enabled.

Power Limit 1
Use this feature to enable or disable platform power limit 1 programming. The options are Disabled and Enabled.

Power Limit 2
Use this feature to enable or disable platform power limit 2 programming. The options are Disabled and Enabled.

Power Limit 3 Override
Select Enabled to support average power limit (PL3) override. The options are Disabled and Enabled.
Power Limit 4 Override
Select Enabled to support average power limit (PL4) override. The options are **Disabled** and **Enabled**.

C-States
Use this feature to enable the C-State of the CPU. The options are **Disabled** and **Enabled**.

Enhanced C-States
Use this feature to enable the enhanced C-State of the CPU. The options are **Disabled** and **Enabled**.

C-State Auto Demotion
Use this feature to prevent unnecessary excursions into the C-States to improve latency. The options are **Disabled** and **C1**.

C-State Un-Demotion
This feature allows you to enable or disable the un-demotion of C-State. The options are **Disabled** and **C1**.

Package C-State Demotion
Use this feature to enable or disable the Package C-State demotion. The options are **Disabled** and **Enabled**.

Package C-State Un-Demotion
Use this feature to enable or disable the Package C-State un-demotion. The options are **Disabled** and **Enabled**.

C-State Pre-Wake
This feature allows you to enable or disable the C-State Pre-Wake. The options are **Disabled** and **Enabled**.

IO MWait Redirection
This feature maps IO_read instructions sent to the IO registers. The options are **Disabled** and **Enabled**.

Package C-State Limit
Use this feature to set the Package C-State limit. The options are C0/C1, C2, C3, C6, C7, C7s, C8, C9, C10, Cpu Default, and **Auto**.

ACPI T-States
Use this feature to enable or disable ACPI T-States. The options are **Disabled** and **Enabled**.
SGX settings

Software Guard Extensions (SGX)
Use this feature to enable or disable software guard extensions. The options are Disabled, Enabled, and Software Controlled.

*If the feature above is set to Software Controlled, the next four features are available for configuration:*

Select Owner EPOCH input type
Use this feature to select the EPOCH mode. The options are No Change is Owner EPOCHs, Change to New Random Owner EPOCHs, and Manual User Defined Owner EPOCHs.

SGX Launch Control Policy
Use this feature to select the Software Guard Extensions launch control policy. The options are Unlocked, Intel Locked, and Locked.

PRMRR Size
The BIOS must reserve a contiguous region of Processor Reserved Memory (PRM) in the Processor Reserved Memory Range Register (PRMRR). The options are 64MB, 128MB, 256MB and 512MB.

Enable/Disable SGX Debug Mode
Use this feature to enable or disable Software Guard Extensions Debug Mode. The options are Disabled and Enabled.

**DDR Speed Control**

Use this feature to set the DDR speed. The options are Auto and Manual.

*If the feature above is set to Manual, Maximum Memory Frequency and SA GV High Gear are available for configuration:*

**Maximum Memory Frequency**

Use this feature to set the maximum memory frequency for onboard memory modules. The options are Auto, 1067, 1200, 1333, 1400, 1600, 1800, 1867, 2000, 2133, 2200, 2400, 2600, 2667, 2800, 2933, 3000, and 3200.

**ECC Support**

Use this feature to enable or disable DDR ECC support. The options are Disabled and Enabled.

**Max TOLUD**

This feature sets the maximum TOLUD value, which specifies the "Top of Low Usable DRAM" memory space to be used by internal graphics devices, GTT Stolen Memory, and TSEG, respectively, if these devices are enabled. The options are Dynamic, 1 GB, 1.25 GB, 1.5 GB, 1.75 GB, 2 GB, 2.25 GB, 2.5 GB, 2.75 GB, 3 GB, 3.25 GB, and 3.5 GB.

**SA GV High Gear**

Use this feature to select the gear for SA GV. The options are Gear1 and Gear2.

**Restrain on Fast Fall**

Use this feature to restart the MRC in cold mode if the software memory test fails during fast flow. The options are Disabled and Enabled.

**Enable RH Prevention**

Use this feature to actively prevent Row Hammer. The options are Disabled and Enabled.

**Power Down Mode**

Use this feature to select the power down mode. The options are Auto, No Power Down, APD, and PPD-DLLoff.
**Pwr Down Idle Timer**
Use this feature to set the power down idle timer. The default value is 0.

**Memory Scrambler**
Use this feature to enable or disable memory scrambler support. The options are Disabled and Enabled.

**Force ColdReset**
Use this feature to enable or disable a cold boot during a MRC execution. The options are Enabled and Disabled.

**Force Single Rank**
Select enabled to use only Rank 0 in each DIMM. The options are Disabled and Enabled.

**Fast Boot**
Use this feature to enable or disable fast path through the memory reference code. The options are Disabled and Enabled.

**Train on Warm boot**
Use this feature to enable or disable training on warm boot. The options are Disabled and Enabled.

**Memory Test on Warm Boot**
Use this feature to enable or disable base memory test run on warm boot. The options are Disabled and Enabled.

**REFRESH_2X_MODE**
Use this feature to enable 2x memory refresh support to enhance memory performance. The options are Disabled, 1- Enabled for WARM or HOT, and 2- Enabled HOT only.

▶ **DMI Configuration**

**DMI Max Link Speed**
Use this feature to select DMI Max Link Speed. The options are Gen1, Gen2, and Gen3.

**DMI Gen3 ASPM Control**
Use this feature to set the Active State Power Management (ASPM) state on the System Agent (SA) side of the DMI Link. The options are Disable, Auto, ASPM L0s, ASPM L1, and ASPM L0sL1.

**DMI De-emphasis Control**
Use this feature to configure the De-emphasis control on DMI. The options are -6 dB and -3.5 dB.
PEG Configuration

CPU SLOT6 PCIe 4.0 x16

CPU SLOT6 PCIe 4.0 x16
Use this feature to enable or disable the PCI Express Graphics (PEG) device in the specified port. The options are Disabled and Enabled.

ASPM
Use this feature to set the Active State Power Management (ASPM) level for a PCIe device. Select Auto for the system BIOS to automatically set the ASPM level based on the system configuration. The options are Disabled, L0s, L1, and L0sL1.

PCIe Speed
Use this feature to select PCIe support for the device installed. The options are Auto, Gen1, Gen2, Gen3, and Gen4.

RSC-SR-68G4 SLOT2 PCIe 4.0 x8

RSC-SR-68G4 SLOT2 PCIe 4.0 x8
Use this feature to enable or disable the PCI Express Graphics (PEG) device in the specified port. The options are Disabled and Enabled.

ASPM
Use this feature to set the Active State Power Management (ASPM) level for a PCIe device. Select Auto for the system BIOS to automatically set the ASPM level based on the system configuration. The options are Disabled, L0s, L1, and L0sL1.

PCIe Speed
Use this feature to select PCIe support for the device installed. The options are Auto, Gen1, Gen2, Gen3, and Gen4.

PEG 0:1:2

PCI Express Root Port 3
Use this feature to enable or disable the PCI Express Graphics (PEG) device in the specified port. The options are Disabled and Enabled.

ASPM
Use this feature to set the Active State Power Management (ASPM) level for a PCIe device. Select Auto for the system BIOS to automatically set the ASPM level based on the system configuration. The options are Disabled, L0s, L1, and L0sL1.
PCle Speed
Use this feature to select PCle support for the device installed. The options are Auto, Gen1, Gen2, Gen3, and Gen4.

CPU SLOT5 PCle 4.0 x4 (in x8)
Use this feature to enable or disable the PCI Express Graphics (PEG) device in the specified port. The options are Disabled and Enabled.

ASPM
Use this feature to set the Active State Power Management (ASPM) level for a PCle device. Select Auto for the system BIOS to automatically set the ASPM level based on the system configuration. The options are Disabled, L0s, L1, and L0sL1.

PCle Speed
Use this feature to select PCle support for the device installed. The options are Auto, Gen1, Gen2, Gen3, and Gen4.

Internal Graphics
Select enable to keep IGFX on the setup options. The options are Disabled and Enabled.

Stop Grant Configuration
Use this feature to set the stop grant configuration on automatic or manual. The options are Auto and Manual.

VT-d
Select Enable to use Intel Virtualization Technology for Direct I/O VT-d support by reporting the I/O device assignments to the Virtual Machine Monitor (VMM) through the DMAR ACPI tables. This feature offers fully-protected I/O resource sharing across Intel platforms, providing greater reliability, security, and availability in networking and data-sharing. The options are Disable and Enable.

X2APIC Opt Out
Use this feature to enable or disable X2APIC Opt Out bit. The options are Enabled and Disabled.

DMA Control Guarantee
Use this feature to enable or disable Direct Memory Access Control Guarantee. The options are Enabled and Disabled.
IGD VTD Enable
Use this feature to enable or disable IGD VTD. The options are **Enabled** and Disabled.

IOP VTD Enable
Use this feature to enable or disable IOP VTD. The options are **Enabled** and Disabled.

Thermal Device (B0:D4:F0)
Use this feature to enable or disable SA Thermal Device. The options are Enabled and Disabled.

GNA Device (B0:D8:F0)
Use this feature to enable or disable SA GNA Device. The options are **Enabled** and Disabled.

Peer Memory Write Enable
Use this feature to enable or disable peer memory write. The options are **Disabled** or Enabled.

➤ PCI Express Root port 1 - 24

ASPM
Use this feature to activate the Active State Power Management (ASPM) level for a PCIe device. Select Auto for the system BIOS to automatically set the ASPM level based on the system configuration. The options are Disabled, L0s, L1, L0sL1, and **Auto**.

L1 Substates
Use this feature to set the PCI Express L1 Substates. The options are Disabled, L1.1, and **L1.1 & L1.2**.

PCle Speed
Use this feature to select the PCI Express port speed. The options are **Auto**, Gen1, Gen2, and Gen3.
Port 61h Bit-4 Emulation
Select Enabled to enable the emulation of Port 61h bit-4 toggling in System Management Mode (SMM). The options are Disabled and Enabled.

PCle PLL SSC
Use this feature to enable or disable PCle PLL SSC. The options are Enabled and Disabled.

Super IO Configuration
- Super IO Chip AST2600

Serial Port 1 Configuration
Serial Port
Select Enabled to enable the selected onboard serial port. The options are Disabled and Enabled.

Device Settings
This feature displays the status of the serial port.

Change Settings
This feature specifies the base I/O port address and the Interrupt Request address of the serial port. Select Auto to allow the BIOS to automatically assign the base I/O and IRQ address. The options are Auto, (IO=3F8h; IRQ=4;), (IO=2F8h; IRQ=4;), (IO=3E8h; IRQ=4;), and (IO=2E8h; IRQ=4;).

Serial Port 2 Configuration
Serial Port
Select Enabled to enable the selected onboard serial port. The options are Disabled and Enabled.

Device Settings
This feature displays the status of the serial port.

Change Settings
This feature specifies the base I/O port address and the Interrupt Request address of the serial port. Select Auto to allow the BIOS to automatically assign the base I/O and IRQ address. The options are Auto, (IO=3F8h; IRQ=3;), (IO=2F8h; IRQ=3;), (IO=3E8h; IRQ=3;), and (IO=2E8h; IRQ=3;).
Serial Port 2 Attribute
Use this feature to select the serial port 2 mode. The options are SOL and COM.

Serial Port Console Configuration

COM1 Console Redirection
Select Enabled to enable console redirection support for the serial port. The options are Disabled and Enabled.

*If the feature above is set to Enabled, the following features are available for configuration:

COM1 Console Redirection Settings

Terminal Type
This feature allows you to select the target terminal emulation type for Console Redirection. Select VT100 to use the ASCII Character set. Select VT100+ to add color and function key support. Select ANSI to use the Extended ASCII Character Set. Select VT-UTF8 to use UTF8 encoding to map Unicode characters into one or more bytes. The options are VT100, VT100+, VT-UTF8, and ANSI.

Bits per second
Use this feature to set the transmission speed for a serial port used in Console Redirection. Make sure that the same speed is used in the host computer and the client computer. A lower transmission speed may be required for long and busy lines. The options are 9600, 19200, 38400, 57600 and 115200 (bits per second).

Data Bits
Use this feature to set the data transmission size for Console Redirection. The options are 7 Bits and 8 Bits.

Parity
A parity bit can be sent along with regular data bits to detect data transmission errors. Select Even if the parity bit is set to 0, and the number of 1’s in data bits is even. Select Odd if the parity bit is set to 0, and the number of 1’s in data bits is odd. Select None if you do not want to send a parity bit with your data bits in transmission. Select Mark to add a mark as a parity bit to be sent along with the data bits. Select Space to add a Space as a parity bit to be sent with your data bits. The options are None, Even, Odd, Mark, and Space.

Stop Bits
A stop bit indicates the end of a serial data packet. Select 1 Stop Bit for standard serial data communication. Select 2 Stop Bits if slower devices are used. The options are 1 and 2.
Flow Control
Use this feature to set the flow control for Console Redirection to prevent data loss caused by buffer overflow. Send a "Stop" signal to stop sending data when the receiving buffer is full. Send a "Start" signal to start sending data when the receiving buffer is empty. The options are None and Hardware RTS/CTS.

VT-UTF8 Combo Key Support
Select Enabled to enable VT-UTF8 Combination Key support for ANSI/VT100 terminals. The options are Disabled and Enabled.

Recorder Mode
Select Enabled to capture the data displayed on a terminal and send it as text messages to a remote server. The options are Disabled and Enabled.

Resolution 100x31
Select Enabled for extended-terminal resolution support. The options are Disabled and Enabled.

Putty KeyPad
This feature selects the settings for Function Keys and KeyPad used for Putty, which is a terminal emulator designed for the Windows OS. The options are VT100, LINUX, XTERMR6, SC0, ESCN, and VT400.

SOL/COM2 Console Redirection
Select Enabled to use the SOL port for Console Redirection. The options are Disabled and Enabled.

*If the feature above is set to Enabled, the following features are available for configuration:

►SOL/COM2 Console Redirection Settings
Use this feature to specify how the host computer exchanges data with the client computer, which is the remote computer.

Terminal Type
Use this feature to select the target terminal emulation type for Console Redirection. Select VT100 to use the ASCII Character set. Select VT100+ to add color and function key support. Select ANSI to use the Extended ASCII Character Set. Select VT-UTF8 to use UTF8 encoding to map Unicode characters into one or more bytes. The options are ANSI, VT100, VT100+, and VT-UTF8.
**Bits per second**

Use this feature to set the transmission speed for a serial port used in Console Redirection. Make sure that the same speed is used in the host computer and the client computer. A lower transmission speed may be required for long and busy lines. The options are 9600, 19200, 38400, 57600 and **115200** (bits per second).

**Data Bits**

Use this feature to set the data transmission size for Console Redirection. The options are 7 Bits and **8 Bits**.

**Parity**

A parity bit can be sent along with regular data bits to detect data transmission errors. Select Even if the parity bit is set to 0, and the number of 1’s in data bits is even. Select Odd if the parity bit is set to 0, and the number of 1’s in data bits is odd. Select None if you do not want to send a parity bit with your data bits in transmission. Select Mark to add a mark as a parity bit to be sent along with the data bits. Select Space to add a Space as a parity bit to be sent with your data bits. The options are None, Even, Odd, Mark and Space.

**Stop Bits**

A stop bit indicates the end of a serial data packet. Select 1 Stop Bit for standard serial data communication. Select 2 Stop Bits if slower devices are used. The options are 1 and 2.

**Flow Control**

Use this feature to set the flow control for Console Redirection to prevent data loss caused by buffer overflow. Send a "Stop" signal to stop sending data when the receiving buffer is full. Send a "Start" signal to start sending data when the receiving buffer is empty. The options are None and Hardware RTS/CTS.

**VT-UTF8 Combo Key Support**

Select Enabled to enable VT-UTF8 Combination Key support for ANSI/VT100 terminals. The options are Disabled and **Enabled**.

**Recorder Mode**

Select Enabled to capture the data displayed on a terminal and send it as text messages to a remote server. The options are **Disabled** and Enabled.

**Resolution 100x31**

Select Enabled for extended-terminal resolution support. The options are Disabled and **Enabled**.

**Putty KeyPad**

This feature selects the settings for Function Keys and KeyPad used for Putty, which is a terminal emulator designed for the Windows OS. The options are **VT100**, LINUX, XTERMR6, SC0, ESCN, and VT400.
Legacy Console Redirection Settings

Redirection COM Port
Use this feature to select the COM port to display redirection of Legacy OS OPROM messages. The options are COM1 and SOL/COM2.

Legacy OS Redirection Resolution
Use this feature to select the number of rows and columns used in Console Redirection for legacy OS support. The options are 80x24 and 80x25.

Redirection After BIOS POST
Use this feature to enable or disable legacy Console Redirection after BIOS POST. When set to Bootloader, legacy Console Redirection is disabled before booting the OS. When set to Always Enable, legacy Console Redirection remains enabled when booting the OS. The options are Always Enable and BootLoader.

EMS (Emergency Management Services) Console Redirection
Select Enabled to use a COM port selected by you for EMS Console Redirection. The options are Enabled and Disabled.

*If the feature above is set to Enabled, the following features are available for configuration:

EMS Console Redirection Settings

Out-of-Band Mgmt Port
The feature selects a serial port in a client server to be used by the Microsoft Windows Emergency Management Services (EMS) to communicate with a remote host server. The options are COM1 and SOL/COM2.

Terminal Type
Use this feature to select the target terminal emulation type for Console Redirection. Select VT100 to use the ASCII character set. Select VT100+ to add color and function key support. Select ANSI to use the extended ASCII character set. Select VT-UTF8 to use UTF8 encoding to map Unicode characters into one or more bytes. The options are VT100, VT100+, VT-UTF8, and ANSI.

Bits Per Second EMS
This item sets the transmission speed for a serial port used in Console Redirection. Make sure that the same speed is used in the host computer and the client computer. A lower transmission speed may be required for long and busy lines. The options are 9600, 19200, 57600, and 115200 (bits per second).
Flow Control EMS

Use this item to set the flow control for Console Redirection to prevent data loss caused by buffer overflow. Send a "Stop" signal to stop sending data when the receiving buffer is full. Send a "Start" signal to start sending data when the receiving buffer is empty. The options are None, Hardware RTS/CTS, and Software Xon/Xoff.

▶ SATA And RSTe Configuration

SATA Controller(s)

This feature enables or disables the onboard SATA controller supported by the Intel PCH chip. The options are Enabled and Disabled.

SATA Mode Selection

Use this feature to select the SATA mode. The options are AHCI and Intel RST Premium With Intel Optane System Acceleration.

*If the feature above is set to Intel RST Premium With Intel Optane System Acceleration, the next four features are available for configuration:

SATA Interrupt Selection

Use this feature to select the SATA interrupt. The options are MSI-x, MSI, and Legacy.

Aggressive LPM Support

When this feature is set to Enable, the SATA AHCI controller manages the power usage of the SATA link. The controller puts the link in a low power mode during extended periods of I/O inactivity and then returns the link to an active state when I/O activity resumes. The options are Disabled and Enabled.

SATA Port 0-7

This feature displays the information detected on the installed SATA drive on the particular SATA port.

SATA Port 0-7 Hot Plug

Set this feature to Enable for hot plug support, which allows you to replace a SATA drive without shutting down the system. The options are Disable and Enable.

SATA Port 0-7 Spin Up Device

Set this feature to enable or disable the PCH to initialize the device. The options are Disable and Enable.
SATA Port 0-7 SATA Device Type
Use this feature to specify if the SATA port specified should be connected to a Solid State Drive or a Hard Disk Drive. The options are **Hard Disk Drive** and Solid State Drive.

**PCH-FW Configuration**

The following firmware information will display:
- General ME Configuration
- Operation Firmware Version
- Backup Firmware Version
- Recovery Firmware Version
- ME Firmware Status #1
- ME Firmware Status #2
- Current State
- Error Code

**ACPI Settings**

**High Precision Event Timer**
Select Enabled to activate the High Precision Event Timer (HPET) that produces periodic interrupts at a much higher frequency than a Real-time Clock (RTC) does in synchronizing multimedia streams, providing smooth playback and reducing the dependency on other timestamp calculation devices, such as an x86 RDTSC Instruction embedded in the CPU. The High Performance Event Timer is used to replace the 8254 Programmable Interval Timer. The options are Disabled and **Enabled**.

**Native PCIE Enable**
Enable this feature to grant control of PCI Express Native hot plug, PCI Express Power Management Events, and PCI Express Capability Structure Control. The options are Disabled and **Enabled**.

**Native ASPM**
Select Enabled for the operating system to control the ASPM or Disabled for the BIOS to control the ASPM. The options are **Auto**, Enabled, and Disabled.
USB Configuration

USB Configuration

USB Module Version:

USB Controllers:

USB Devices:

Legacy USB Support
Select Enabled to support onboard legacy USB devices. Select Auto to disable legacy support if there are no legacy USB devices present. Select Disable to have all USB devices available for EFI applications only. The options are Enabled, Disabled, and Auto.

XHCI Hand-off
This is a work-around solution for operating systems that do not support Extensible Host Controller Interface (XHCI) hand-off. The XHCI ownership change should be claimed by the XHCI driver. The settings are Enabled and Disabled.

USB Mass Storage Driver Support
Select Enabled for USB mass storage device support. The options are Disabled and Enabled.

USB hardware delays and time-outs:

USB transfer time-out
Use this feature to set the time out value for Control, Bulk, and Interrupt transfers. The options are 1 sec, 5 sec, 10 sec, and 20 sec.

Device reset time-out
Use this feature to set the USB mass storage device Start Unit command time out. The options are 10 sec, 20 sec, 30 sec, and 40 sec.

Device power-up delay
Use this feature to set the maximum time the device will take before it reports itself to the host controller. The options are Auto and Manual.

Mass Storage Devices:

USB Flash Disk V1.0
Use this feature to select the mass storage device emulation type. The options are Auto, Floppy, Forced FDD, Hard Disk, and CD-ROM.
 PCIe/PCI/PnP Configuration

Onboard Video Option ROM
Use this feature to select which firmware function to be loaded for LAN1 used for system boot. The options are Disabled and Legacy (if the Boot Mode Select feature under the Boot tab is set to Legacy), Disabled and EFI (if the Boot Mode Select feature under the Boot tab is set to UEFI), and Disabled, Legacy, and EFI (if the Boot Mode Select feature under the Boot tab is set to Dual).

Above 4GB MMIO BIOS assignment
Select Enabled to decode a PCI device that supports 64-bit in the space above 4G Address. The options are Disabled and Enabled.

VGA Priority
Use this feature to select the active video type. The options are Onboard and Offboard.

NVMe Firmware Source
The feature determines which type of NVMe firmware should be used in your system. The options are Vendor Defined Firmware and AMI Native Support.

Storage Option ROM/UEFI Driver
This feature controls the execution of UEFI and Legacy storage option ROM. The options are Do not launch, UEFI, and Legacy.

PCle/PCI/PnP Configuration

PCH SLOT4 PCIe 3.0 x4 OPROM
Use this feature to select which firmware type to be loaded for the add-on card in this slot. The options are Disabled and Legacy (if the Boot Mode Select feature under the Boot tab is set to Legacy), Disabled and EFI (if the Boot Mode Select feature under the Boot tab is set to UEFI), and Disabled, Legacy, and EFI (if the Boot Mode Select feature under the Boot tab is set to Dual).

CPU SLOT5 PCIe 4.0 x4 OPROM
Use this feature to select which firmware type to be loaded for the add-on card in this slot. The options are Disabled and Legacy (if the Boot Mode Select feature under the Boot tab is set to Legacy), Disabled and EFI (if the Boot Mode Select feature under the Boot tab is set to UEFI), and Disabled, Legacy, and EFI (if the Boot Mode Select feature under the Boot tab is set to Dual).
**CPU SLOT6 PCIe 4.0 x16 OPROM**

Use this feature to select which firmware type to be loaded for the add-on card in this slot. The options are Disabled and **Legacy** (if the Boot Mode Select feature under the Boot tab is set to Legacy), Disabled and **EFI** (if the Boot Mode Select feature under the Boot tab is set to UEFI), and Disabled, Legacy, and **EFI** (if the Boot Mode Select feature under the Boot tab is set to Dual).

**M.2-P OPROM**

Use this feature to select which firmware type to be loaded for the add-on card in this slot. The options are Disabled and **Legacy** (if the Boot Mode Select feature under the Boot tab is set to Legacy), Disabled and **EFI** (if the Boot Mode Select feature under the Boot tab is set to UEFI), and Disabled, Legacy, and **EFI** (if the Boot Mode Select feature under the Boot tab is set to Dual).

**Onboard LAN1/2/3/4 Support**

Use this feature to enable or disable the onboard LAN port. The X12STH-F only supports two onboard LAN devices. The options are **Enabled** and Disabled.

**Onboard LAN1 Option ROM**

Use this feature to select a desired firmware function to be loaded for onboard LAN1. The options are Disabled and **Legacy** (if the Boot Mode Select feature under the Boot tab is set to Legacy), Disabled and **EFI** (if the Boot Mode Select feature under the Boot tab is set to UEFI), and Disabled, Legacy, and **EFI** (if the Boot Mode Select feature under the Boot tab is set to Dual).

▶️**Network Configuration**

**Network Stack**

Select Enabled to enable Preboot Execution Environment (PXE) or Unified Extensible Firmware Interface (UEFI) for network stack support. The options are Disabled and **Enabled**.

**IPv4 PXE Support**

Select Enabled to enable IPv4 PXE boot support. The options are Disabled and **Enabled**.

**IPv4 HTTP Support**

Select Enabled to enable IPv4 HTTP boot support. The options are **Disabled** and Enabled.

**IPv6 PXE Support**

Select Enabled to enable IPv6 PXE boot support. The options are Disabled and **Enabled**.

**IPv6 HTTP Support**

Select Enabled to enable IPv6 HTTP boot support. The options are **Disabled** and Enabled.
**PXE boot wait time**

Use this option to specify the wait time to press the ESC key to abort the PXE boot. Press "+" or "+" on your keyboard to change the value. The default setting is 0.

**Media detect count**

Use this option to specify the number of times media is checked. Press "+" or "-" on your keyboard to change the value. The default setting is 1.

*If the feature above is set to Enabled, the next five features are available for configuration:

**Enable DHCP**

Use this feature to enable Dynamic Host Configuration Protocol. If this feature is enabled, then you don’t have the option of manually entering the network addresses. The options are Disabled and Enabled.

**Local IP Address**

Use this feature to enter the local IP address.

**Local Netmask**

Use this feature to enter the local Netmask address.

**Local Gateway**

Use this feature to enter the local Gateway address.

**Local DNS Servers**

Use this feature to enter the local DNS Server address.

**Save Changes and Exit**

Use this feature to save the changes and exit from the menu.
Enter Configuration Menu

Use this feature to select the automatic or manual policy. The options are automatic and manual.

Save Changes and Exit
Use this feature to save the changes and exit from the menu.

Trusted Computing

The following Trusted Platform Module (TPM) information is displayed if a TPM 2.0 module is detected:

- Vendor Name
- Firmware Version

Security Device Support
If this feature and the TPM jumper on the motherboard are both set to Enabled, onboard security devices are enabled for Trusted Platform Module (TPM) support to enhance data integrity and network security. Reboot the system for changes to take effect. The options are Disable and Enable.

- Active PCR Bank
• Available PCR banks

SHA-1 PCR Bank
Use this feature to disable or enable the SHA-1 Platform Configuration Register (PCR) bank for the installed TPM device. The options are Disabled and Enabled.

SHA256 PCR Bank
Use this feature to disable or enable the SHA256 Platform Configuration Register (PCR) bank for the installed TPM device. The options are Disabled and Enabled.

Pending Operation
Use this feature to schedule a TPM-related operation to be performed by a security device for system data integrity. Your system will reboot to carry out a pending TPM operation. The options are None and TPM Clear.

Platform Hierarchy
Use this feature to disable or enable platform hierarchy for platform protection. The options are Disabled and Enabled.

Storage Hierarchy
Use this feature to disable or enable storage hierarchy for cryptographic protection. The options are Disabled and Enabled.

Endorsement Hierarchy
Use this feature to disable or enable endorsement hierarchy for privacy control. The options are Disabled and Enabled.

TPM 2.0 UEFI Spec Version
Use this feature to select the TCG2 spec version. The options are TCG_1_2 and TCG_2.

Physical Presence Spec Version
Use this feature to select the Physical Presence Spec version. The options are 1.2 and 1.3.

PH Randomization
Use this feature to disable or enable Platform Hierarchy (PH) Randomization. The options are Disabled and Enabled.

TXT Support
Intel Trusted Execution Technology (TXT) helps protect against software-based attacks and ensures protection, confidentiality, and integrity of data stored or created on the system. Use this feature to enable or disable TXT Support. The options are Disabled and Enabled.
HTTP Boot Configuration

HTTP Boot Configuration

HTTP Boot Policy
Use this feature to select the boot policy. The options are Apply to all LANs, Apply to each LAN, and Boot Priority #1 instantly.

HTTPS Boot Checks Hostname
Enable this feature for HTTPS boot to check the hostname of the TLS certificates to see if it matches the hostname provided by the remote server. The options are Enabled and Disabled (WARNING: Security Risk!!).

Priority of HTTP Boot:

Instance of Priority 1:
Use this feature to set the rank target port. The default value is 1.

Select IPv4 or IPv6
Use this feature to select which LAN port to boot from. The options are IPv4 and IPv6.

Boot Description
Highlight the feature and press enter to create a boot description. The description cannot be more than 75 characters.

Boot URI
Highlight the feature and press enter to create a boot URI.

Instance of Priority 2/3/4
Use this feature to set the rank target port. The default value is 0.

4.4 Event Logs

Use this menu to configure Event Log settings.

► Change SMBIOS Event Log Settings

Enabling/Disabling Options

SMBIOS Event Log
Change this feature to enable or disable all features of the SMBIOS Event Logging during system boot. The options are Disabled and Enabled.

Erasing Settings

Erase Event Log
If No is selected, data stored in the event log will not be erased. Select Yes, Next Reset, data in the event log will be erased upon next system reboot. Select Yes, Every Reset, data in the event log will be erased upon every system reboot. The options are No, Yes, Next reset, and Yes, Every reset.

When Log is Full
Select Erase Immediately for all messages to be automatically erased from the event log when the event log memory is full. The options are Do Nothing and Erase Immediately.

SMBIOS Event Log Standard Settings
Log System Boot Event
This option toggles the System Boot Event logging to enabled or disabled. The options are Disabled and Enabled.

MECI
The Multiple Event Count Increment (MECI) counter counts the number of occurrences that a duplicate event must happen before the MECI counter is incremented. This is a numeric value. The default value is 1.

METW
The Multiple Event Time Window (METW) defines the number of minutes that must pass between duplicate log events before MECI is incremented. This is in minutes, from 0 to 99. The default value is 60.

Note: After making changes on a setting, reboot the system for the changes to take effect.

View SMBIOS Event Log
Select this submenu and press enter to see the contents of the SMBIOS event log. The following categories will be displayed: Date/Time/Error Codes/Severity.
4.5 IPMI

Use this menu to configure Intelligent Platform Management Interface (IPMI) settings.

**BMC Firmware Revision**
This item indicates the IPMI firmware revision used in your system.

**IPMI STATUS (Baseboard Management Controller)**
This item indicates the status of the IPMI firmware installed in your system.

**System Event Log**

**Enabling/Disabling Options**

**SEL Components**
Select Enabled for all system event logging at boot up. The options are **Enabled** and **Disabled**.

**Erasing Settings**

**Erase SEL**
Select Yes, On next reset to erase all system event logs upon next system reboot. Select Yes, On every reset to erase all system event logs upon each system reboot. Select No to keep all system event logs after each system reboot. The options are **No**, **Yes, On next reset**, and **Yes, On every reset**.
When SEL is Full
This feature allows you to decide what the BIOS should do when the system event log is full. Select Erase Immediately to erase all events in the log when the system event log is full. The options are Do Nothing and Erase Immediately.

Note: After making changes on a setting, reboot the system for the changes to take effect.

BMC Network Configuration

BMC Network Configuration
Update IPMI LAN Configuration
Select Yes for the BIOS to implement all IP/MAC address changes at the next system boot. The options are No and Yes.

*If the feature above is set to Yes, Configuration Address Source, VLAN, and IPv6 Support are available for configuration:

Configure IPv4 Support
IPMI LAN Selection
IPMI Network Link Status
Configuration Address Source
This feature allows you to select the source of the IP address for this computer. If Static is selected, you will need to know the IP address of this computer and enter it to the system manually in the field. If DHCP is selected, the BIOS will search for a DHCP (Dynamic Host Configuration Protocol) server in the network that is attached to and request the next available IP address for this computer. The options are Static and DHCP.

*If the feature above is set to Static, the following features are available for configuration:

Station IP Address
This features displays the Station IP address for this computer. The address can be manually entered. This should be in decimal and in dotted quad form (i.e., 192.168.10.253).

Subnet Mask
This feature displays the sub-network that this computer belongs to. The address can be manually entered. The value of each three-digit number separated by dots should not exceed 255.

Station MAC Address
**Gateway IP Address**
This feature displays the Gateway IP address for this computer. The address can be manually entered. This should be in decimal and in dotted quad form (i.e., 172.31.0.1).

**VLAN**
This feature displays the virtual LAN settings. The options are **Disable** and **Enable**.

**VLAN ID**
This feature is enabled if VLAN is enabled. Enter a VLAN ID. The ID range is from 1 to 4094.

**Configure IPv6 Support**

**IPv6 Address Status**

**IPv6 Support**
Use this feature to enable IPv6 support. The options are **Enabled** and **Disabled**.

*If the feature above is set to Enabled, Configuration Address Source is available for configuration:*

**Configuration Address Source**
This feature allows you to select the source of the IP address for this computer. If Static is selected, you will need to know the IP address of this computer and enter it to the system manually in the field. If DHCP is selected, the BIOS will search for a DHCP (Dynamic Host Configuration Protocol) server in the network that is attached to and request the next available IP address for this computer. The options are **Static** and **DHCP**.

**Station IPv6 Address**

**Prefix Length**

**IPv6 Router1 IP Address**
4.6 Security

Use this menu to configure the following security settings for the system.

**Administrator Password**
Press Enter to create a new, or change an existing, Administrator password.

**Password Check**
Select Setup for the system to check for a password at Setup. Select Always for the system to check for a password at boot up or upon entering the BIOS Setup utility. The options are **Setup** and **Always**.

**Hard Drive Security Frozen**
Use this feature to enable or disable the BIOS security frozen command for SATA and NVMe devices. The options are Enable and **Disable**.

**Lockdown Mode**
Use this feature to switch to lockdown mode. The options are **Disabled** and Enabled.

**Secure Boot**

This section displays the contents of the following secure boot features:

- **System Mode**
- **Secure Boot**
Secure Boot
Use this feature to enable secure boot. The options are **Disabled** and **Enabled**.

Secure Boot Mode
Use this item to configure Secure Boot variables without authentication. The options are **Standard** and **Custom**.

This feature is for manufacturing debugging purposes.

▶ Restore Factory Keys
Force System to User Mode. Install factory default Secure Boot key databases.

▶ Reset to Setup Mode
This feature deletes all Secure Boot key databases from NVRAM.

▶ Enter Audit Mode
Use this feature to enter the audit mode workflow.

▶ Key Management
This submenu allows you to configure the following Key Management settings.

▶ Provision Factory Keys
Force System to User Mode. Install factory default Secure Boot key databases.

▶ Restore Factory Keys
Force System to User Mode. Install factory default Secure Boot key databases.

▶ Reset to Setup Mode
This feature deletes all Secure Boot key databases from NVRAM.

▶ Export Secure Boot variables
This feature allows you to copy NVRAM content of Secure boot variables to files in a root folder on a file system device.

**Enroll Efi Image**

This feature allows the image to run in Secure Boot Mode. Enroll SHA256 Hash Certificate of the image into the Authorized Signature Database.

**Device Guard Ready**

**Remove 'UEFI CA' from DB**

This feature allows you to decide if all secure boot variables should be saved.

**Restore DB defaults**

Select Yes to restore the DB defaults.

**Secure Boot variable**

**Platform Key (PK)**

**Update**

Select Yes to load a factory default PK or No to load from a file on an external media.

**Key Exchange Key**

**Update**

Select Yes to load a factory default KEK or No to load from a file on an external media.

**Append**

Select Yes to add the KEK from the manufacturer's defaults list to the existing KEK. Select No to load the KEK from a file. The options are Yes and No.

**Authorized Signatures**

**Update**

Select Yes to load a factory default DB or No to load from a file on an external media.

**Append**

Select Yes to add the DB from the manufacturer's defaults list to the existing DB. Select No to load the DB from a file. The options are Yes and No.
Forbidden Signatures

Update
Select Yes to load a factory default DBX or No to load from a file on an external media.

Append
Select Yes to add the DBX from the manufacturer's defaults list to the existing DBX. Select No to load the DBX from a file. The options are Yes and No.

Authorized TimeStamps

Update
Select Yes to load a factory default DBT or No to load from a file on an external media.

Append
Select Yes to add the DBT from the manufacturer's defaults list to the existing DBT. Select No to load the DBT from a file. The options are Yes and No.

OsRecovery Signature

Update
Select Yes to load a factory default DBR or No to load from a file on an external media.

Append
Select Yes to add the DBR from the manufacturer's defaults list to the existing DBR. Select No to load the DBR from a file. The options are Yes and No.

4.8 Save & Exit

Use this menu to save settings and exit from the BIOS.

Save Options

Discard Changes and Exit
Select this option to quit the BIOS Setup without making any permanent changes to the system configuration, and reboot the computer. Select Discard Changes and Exit from the Save & Exit menu and press <Enter>.

Save Changes and Reset
After completing the system configuration changes, select this option to save the changes you have made. This will not reset (reboot) the system.

Save Changes
When you have completed the system configuration changes, select this option to leave the BIOS setup utility and reboot the computer for the new system configuration parameters to take effect. Select Save Changes from the Save & Exit menu and press <Enter>.

Discard Changes
Select this option and press <Enter> to discard all the changes and return to the AMI BIOS utility program.

BIOS Codes

A.1 BIOS Error POST (Beep) Codes

During the POST (Power-On Self-Test) routines, which are performed each time the system is powered on, errors may occur.

Non-fatal errors are those which, in most cases, allow the system to continue the boot up process. The error messages normally appear on the screen.

Fatal errors are those which will not allow the system to continue the boot up process. If a fatal error occurs, you should consult with your system manufacturer for possible repairs.

These fatal errors are usually communicated through a series of audible beeps. The table shown below lists some common errors and their corresponding beep codes encountered by users.

<table>
<thead>
<tr>

A.2 Additional BIOS POST Codes

The AMI BIOS supplies additional checkpoint codes, which are documented online at http://www.supermicro.com/support/manuals/ ("AMI BIOS POST Codes User's Guide"). For information on AMI updates, please refer to http://www.ami.com/products/.

Software

After the hardware has been installed, you can install the Operating System (OS), configure RAID settings and install the drivers.

B.1 Microsoft Windows OS Installation

If you will be using RAID, you must configure RAID settings before installing the Windows OS and the RAID driver. Refer to the RAID Configuration User Guides posted on our website at www.supermicro.com/support/manuals.

Installing the OS

1. Create a method to access the MS Windows installation ISO file. That might be a DVD, perhaps using an external USB/SATA DVD drive or a USB flash drive.

2. Retrieve the proper RST/RSTe driver. Go to the Supermicro web page for your motherboard and click on "Download the Latest Drivers and Utilities", select the proper driver, and copy it to a USB flash drive.

3. Boot from a bootable device with Windows OS installation. You can see a bootable device list by pressing <F11> during the system startup.

![Figure B-1. Select Boot Device](image-url)
4. During Windows Setup, continue to the dialog where you select the drives on which to install Windows. If the disk you want to use is not listed, click on “Load driver” link at the bottom left corner.

![Figure B-2. Load Driver Link](image)

Figure B-2. Load Driver Link

To load the driver, browse the USB flash drive for the proper driver files.

- For RAID, choose the SATA/sSATA RAID driver indicated then choose the storage drive on which you want to install it.

- For non-RAID, choose the SATA/sSATA AHCI driver indicated then choose the storage drive on which you want to install it.

5. Once all devices are specified, continue with the installation.

6. After the Windows OS installation has completed, the system will automatically reboot multiple times.
B.2 Driver Installation

The Supermicro website that contains drivers and utilities for your system is at https://www.supermicro.com/wdl/driver. Some of these must be installed, such as the chipset driver.

After accessing the website, go into the https://www.supermicro.com/wdl/CDR_Images/CDR-X12-UP/ and locate the ISO file for your motherboard. Download this file to a USB flash drive or a DVD and mount the ISO file as virtual media using the iKVM console for access. You may also use a utility to extract the ISO file if preferred.

Another option is to go to the Supermicro website and search for the motherboard. Find the product page for your motherboard and download the latest drivers and utilities.

![Figure B-3. Driver & Tool Installation Screen](image)

**Note:** Click the icons showing a hand writing on paper to view the readme files for each item. Click the computer icons to the right of these items to install each item (from top to bottom) one at a time. **After installing each item, you must reboot the system before moving on to the next item on the list.** The bottom icon with a CD on it allows you to view the entire contents.
B.3 SuperDoctor® 5

The Supermicro SuperDoctor 5 is a program that functions in a command-line or web-based interface for Windows and Linux operating systems. The program monitors such system health information as CPU temperature, system voltages, system power consumption, fan speed, and provides alerts via email or Simple Network Management Protocol (SNMP). SuperDoctor 5 comes in local and remote management versions and can be used with Nagios to maximize your system monitoring needs. With SuperDoctor 5 Management Server (SSM Server), you can remotely control power on/off and reset chassis intrusion for multiple systems with SuperDoctor 5. SuperDoctor 5 Management Server monitors HTTP, FTP, and SMTP services to optimize the efficiency of your operation.

Standardized Warning Statements

The following statements are industry standard warnings, provided to warn the user of situations which have the potential for bodily injury. Should you have questions or experience difficulty, contact Supermicro’s Technical Support department for assistance. Only certified technicians should attempt to install or configure components.

Read this section in its entirety before installing or configuring components.

These warnings may also be found on our website at http://www.supermicro.com/about/policies/safety_information.cfm.

Battery Handling

**Warning!** There is the danger of explosion if the battery is replaced incorrectly. Replace the battery only with the same or equivalent type recommended by the manufacturer. Dispose of used batteries according to the manufacturer’s instructions.

電池の取り扱い

電池交換が正しく行われなかった場合、破裂の危険性があります。交換する電池はメーカーが推奨する型、または同等のものを使用下さい。使用済電池は製造元の指示に従って処分して下さい。

警告

电池更换不当会有爆炸危险。请只使用同类电池或制造商推荐的功能相当的电池更换原有电池。请按制造商的说明处理废旧电池。

警告

電池更換不當會有爆炸危險。請使用製造商建議之相同或功能相當的電池更換原有電池。請按照製造商的說明指示處理廢棄舊電池。

Attention

Danger d'explosion si la pile n'est pas remplacée correctement. Ne la remplacer que par une pile de type semblable ou équivalent, recommandée par le fabricant. Jeter les piles usagées conformément aux instructions du fabricant.

¡Advertencia!

Existe peligro de explosión si la batería se reemplaza de manera incorrecta. Reemplazar la batería exclusivamente con el mismo tipo o el equivalente recomendado por el fabricante. Desechar las baterías gastadas según las instrucciones del fabricante.

경고!

배터리가 올바르게 교체되지 않으면 폭발의 위험이 있습니다. 기존 배터리와 동일하거나 제조사에서 권장하는 동등한 종류의 배터리로만 교체해야 합니다. 제조사의 안내에 따라 사용된 배터리를 처리하여 주십시오.

Waarschuwing

Er is ontploffingsgevaar indien de batterij verkeerd vervangen wordt. Vervang de batterij slechts met hetzelfde of een equivalent type die door de fabrikant aanbevolen wordt. Gebruikte batterijen dienen overeenkomstig fabrieksvoorschriften afgevoerd te worden.
Product Disposal

Warning! Ultimate disposal of this product should be handled according to all national laws and regulations.

UEFI BIOS Recovery

Warning: Do not upgrade the BIOS unless your system has a BIOS-related issue. Flashing the wrong BIOS can cause irreparable damage to the system. In no event shall Supermicro be liable for direct, indirect, special, incidental, or consequential damages arising from a BIOS update. If you need to update the BIOS, do not shut down or reset the system while the BIOS is updating to avoid possible boot failure.

D.1 Overview

The Unified Extensible Firmware Interface (UEFI) provides a software-based interface between the operating system and the platform firmware in the pre-boot environment. The UEFI specification supports an architecture-independent mechanism that will allow the UEFI OS loader stored in an add-on card to boot the system. The UEFI offers clean, hands-off management to a computer during system boot.

D.2 Recovering the UEFI BIOS Image

A UEFI BIOS flash chip consists of a recovery BIOS block and a main BIOS block (a main BIOS image). The recovery block contains critical BIOS codes, including memory detection and recovery codes for the user to flash a healthy BIOS image if the original main BIOS image is corrupted. When the system power is first turned on, the boot block codes execute first. Once this process is completed, the main BIOS code will continue with system initialization and the remaining POST (Power-On Self-Test) routines.

Note 1: Follow the BIOS recovery instructions below for BIOS recovery when the main BIOS block crashes.

Note 2: When the BIOS recovery block crashes, you will need to follow the procedures to make a Returned Merchandise Authorization (RMA) request. (For a RMA request, please see section 3.5 for more information).
D.3 Recovering the BIOS Block with a USB Device

This feature allows the user to recover the main BIOS image using a USB-attached device without additional utilities used. A USB flash device such as a USB Flash Drive, or a USB CD/DVD ROM/RW device can be used for this purpose. However, a USB Hard Disk drive cannot be used for BIOS recovery at this time.

The file system supported by the recovery block is FAT (including FAT12, FAT16, and FAT32), which is installed on a bootable or non-bootable USB-attached device. However, the BIOS might need several minutes to locate the SUPER.ROM file if the media size becomes too large due to the huge volumes of folders and files stored in the device.

To perform UEFI BIOS recovery using a USB-attached device, follow the instructions below:
1. Using a different machine, copy the "Super.ROM" binary image file into the disc Root "\" directory of a USB device or a writable CD/DVD.

   **Note 1:** If you cannot locate the "Super.ROM" file in your driver disk, visit our website at [www.supermicro.com](http://www.supermicro.com) to download the BIOS package. Extract the BIOS binary image into a USB flash device and rename it "Super.ROM" for the BIOS recovery use.
Note 2: Before recovering the main BIOS image, confirm that the "Super.ROM" binary image file you download is the same version or a close version meant for your motherboard.

2. Insert the USB device that contains the new BIOS image ("Super.ROM") into your USB port and reset the system until the following screen appears:

3. After locating the new BIOS binary image, the system will enter the BIOS Recovery menu as shown below:

   Note: At this point, you may decide if you want to start the BIOS recovery. If you decide to proceed with BIOS recovery, follow the procedures below.
4. When the screen as shown above displays, use the arrow keys to select the item "Proceed with flash update" and press the <Enter> key. You will see the BIOS recovery progress as shown in the screen below:

![BIOS Recovery Screen]

Note: *Do not interrupt the BIOS flashing process until it has completed.*

5. After the BIOS recovery process is completed, press any key to reboot the system.

6. Using a different system, extract the BIOS package into a USB flash drive.

7. Press <Del> during system boot to enter the BIOS Setup utility. From the top of the tool bar, select Boot to enter the submenu. From the submenu list, select Boot Option #1 as shown below. Then, set Boot Option #1 to [UEFI AP:UEFI: Built-in EFI Shell]. Press <F4> to save the settings and exit the BIOS Setup utility.
8. When the UEFI Shell prompt appears, type `fs#` to change the device directory path. Go to the directory that contains the BIOS package you extracted earlier from Step 6. Enter `flash.nsh BIOSname.###` at the prompt to start the BIOS update process.

**Note:** *Do not interrupt this process* until the BIOS flashing is complete.

9. The screen above indicates that the BIOS update process is complete. When you see the screen above, unplug the AC power cable from the power supply, clear CMOS, and plug the AC power cable in the power supply again to power on the system.

10. Press `<Del>` to enter the BIOS Setup utility.

11. Press `<F3>` to load the default settings.

12. After loading the default settings, press `<F4>` to save the settings and exit the BIOS Setup utility.
